

Modernize your network with HPE Aruba Networking

Your enterprise network is more than just infrastructure. Responsible for data capture, security, transport and delivery, it's more like the beating heart of your connected business.

This heart, the “command center” of your operations, must work increasingly hard. In today's high-demand environment, the network must be up to the task of delivering exceptional digital experiences, protecting the organization, and ensuring real-time access to information from any source, at any time, from any location. It must support hyper-distributed edge environments and IoT connected devices to deliver fast and secure connectivity to applications, services, and data hosted in the cloud and data centers.

The speed of AI is also both reliant on and reflective of how well existing networks are coping with multiple workloads — most are battling to keep up.

Where your network falls short and how to raise it up

Why are existing networks buckling under modern demands? Increasingly, it's because networking solutions are taking the “more is more” approach. Adding more layers, using more tools, creating more silos and, ultimately, giving rise to more complexity.

The resulting struggle your network faces will filter down into your business, where:

- Dangerous security gaps will be created.
- Employees and customers will have sub-par online experiences.
- AI initiatives will stall, impeding your ability to gain operational efficiencies and competitive advantage.
- New business models will take longer to implement, affecting your time to market.
- Archaic, manual networking processes will lead to wasted IT resources.

With problems spanning architecture and operations to security, the network solution must be comprehensive. What you need is a **security-first, AI-powered network** to drive your connected enterprise and AI ambitions. What you need is to modernize with HPE Aruba Networking.

Achieve your goals with a modernized network

Unlike many other network providers, Hewlett Packard Enterprise offers a simplified, open, AI-ready networking approach that is free from the limitations of outdated systems and restrictive, costly vendor lock-ins.

By modernizing your network with HPE, you can experience:

1. AI-powered connectivity options to meet different business demands
2. A network that serves as a security solution
3. Integrated AI for task time-saving and faster decision-making
4. Cost-efficient flexibility to adapt to changing business needs faster

The challenge for network decision-maker lies in building a network for the future, when expectations are likely to vary greatly from what we know today.

That's why network modernization is not a destination. It's an ongoing journey, and one that HPE will support you on, every step of the way.

We continually innovate to keep pace with the ever-changing market landscape, ensuring your network keeps you ahead.

1. AI-powered connectivity options to meet different business demands

The future of the enterprise network is not either/or. Multiple different types of connectivity — Wi-Fi, wired, private 5G, SD-WAN and others — are and will continue to be used in the enterprise to support a wide range of use cases. And HPE Aruba Networking has you covered.

Our broad portfolio supports your diverse and growing connectivity needs. Mix and match with:

- A host of Wi-Fi CERTIFIED™ access points designed for indoor, outdoor, ruggedized, and remote environments.
- AI-powered Wi-Fi 7 that goes beyond the standard: maximizing wireless performance, strengthening network security, enhancing location-based services, and acting as a secure IoT platform.
- Turnkey private 5G, purpose-built for the enterprise, meeting requirements for wide area coverage, high speed mobility, and dedicated coverage for mission-critical applications — while eliminating the cellular complexity holding back adoption.
- A wide range of high performance, always-on access, core and data center switches — all managed with the same intuitive interface and common configuration policies to drive greater operational efficiencies and decreased security risk.
- A secure SD-WAN that delivers high performance and availability with intelligent routing, no matter where applications reside.

Underpinning this connectivity suite is an innovative and AI-powered management solution called HPE Aruba Networking Central. It provides full-stack observability, end-to-end optimization, and streamlined orchestration across branch, remote office, campus, data center, and IoT networks — all through a single management interface. No more complexity — Central is an easy way for you to maintain visibility and control across multiple environments. And it offers more deployment options than any other vendor: whether that's public software as a service (SaaS), on-premises, a dedicated Virtual Private Cloud (VPC), or network as a service (NaaS).

2. A network that serves as a security solution

The need for ubiquitous connectivity and relentless cyber threats have made it harder than ever to identify and close security gaps. It's time to start utilizing a new tool to protect the organization: the network.

Unlike bolt-on security solutions, which introduce complexity, decrease threat-response times, and result in poor performance, HPE Aruba Networking delivers built-in security based on the principles of SASE and zero trust with cloud-based network access control. Solutions such as next generation firewalls and IPS/IDS are also built into the network. This enables you to better protect the organization by expanding zero trust everywhere — for all users and devices trying to access your network, including third-parties, unmanaged IoT, and BYOD, across remote locations, branch, campus, and data centers. It also reduces vendor and appliance proliferation, increasing the efficiency of your security ecosystem.

The result?

- **Enhanced security:** Constantly monitor the network and dynamically adjust trust in real-time with zero trust principles driven by AI.
- **Cost and resource efficiency:** Start on a universal ZTNA journey by consolidating access control with a single interface and policy engine with Cloud NAC and SSE. Retire legacy VPNs for seamless, app-specific remote access. In branch offices, use a secure SD-WAN to replace routers and branch firewalls with a built-in next-generation firewall, providing advanced security capabilities such as IDS/IPS, DDoS defense and role-based segmentation.
- **Compliance:** Adhere to regulatory mandates such as PCI DSS, HIPAA and NIS2 by enforcing zero trust principles across your organization, remote locations and hybrid workers.

3. Time-saving automation and actionable AI insights

AI for networking is fast becoming a business imperative, with 83% of IT wanting AI-powered management in their networks¹ for support with things like device profiling for network security, root cause analysis, and identification of network problems. But actionable AI that produces trustworthy outcomes depends on three key ingredients: an extensive volume and variety of data, domain expertise, and deep data science experience.

HPE Aruba Networking offers AI-powered capabilities that are architected into the network management solution, with models trained on one of the industry’s largest data lakes fed by millions of network devices and billions of unique endpoints, for AI that offers valuable insights and recommendations.

AI capabilities in HPE Aruba Networking Central

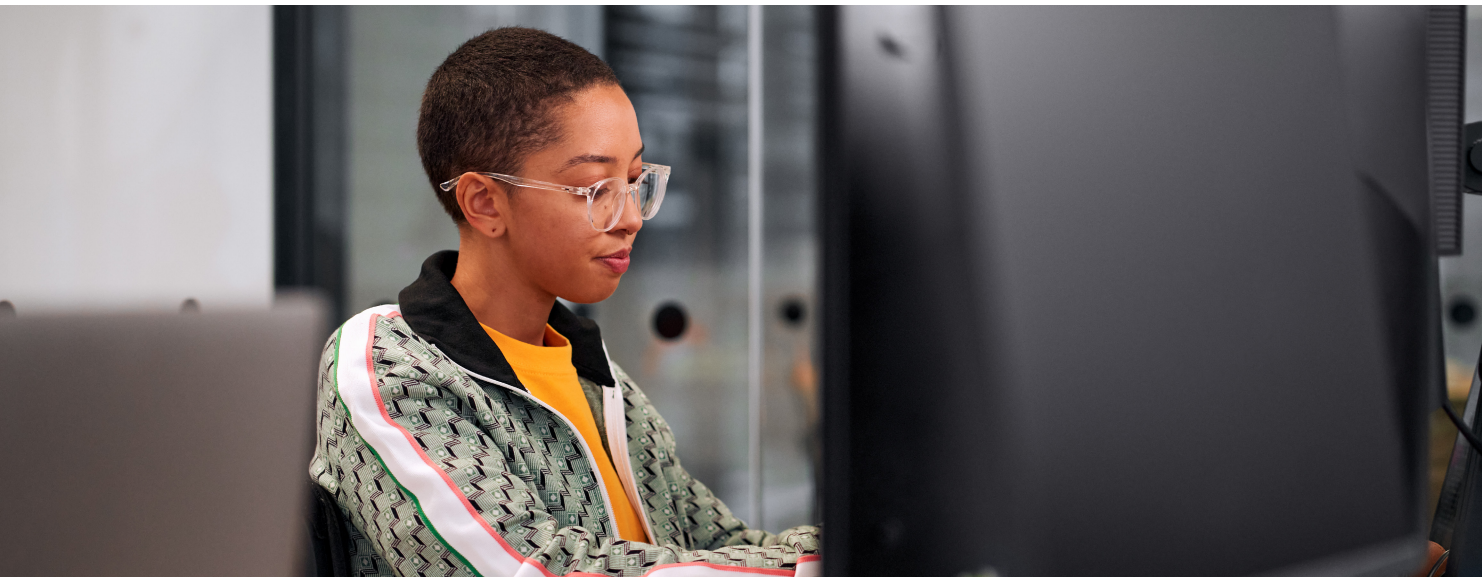

AI search	AI insights	Enhanced IoT visibility and security.
Get sub second summaries of the latest validated reference designs and tech documents with a GenAI-powered solution.	Receive tailored recommendations on firmware updates, performance enhancements, and power saving suggestions.	Accurately categorize and identify IoT and traditional devices by analyzing dynamic attributes and behavioral characteristics. And enhance IoT security with recommendations for least-privilege access policies.

4. Cost-effective flexibility and agility

Rapidly changing business objectives require a network that can quickly — and automatically — adjust to new or changing conditions. With HPE Aruba Networking Central as your single point of visibility and control across networks (wired, wireless, and WAN), you can act faster.

Stay at the leading edge	Deploy new devices faster	Have more choice	Remain agile
As a cloud-native management solution, Central by its nature delivers a continuous stream of updates and new functionality to keep you at the leading edge. Microservices architecture also offers the modularity required to rapidly integrate industry-leading capabilities.	New hierarchical configuration and device-agnostic workflows simplify the setup of switches, gateways, and access points, enabling you to rapidly deploy network devices as demand arises.	Vendor lock-in is the antithesis of flexibility. Central offers open, standardized APIs, third-party integrations, and flexible deployment — giving you choice, control, and compatibility.	A network as a service consumption model lets you acquire and deploy the latest technology faster and more efficiently.

Modernize with HPE

Ready to take your next step in network modernization? Let us help. We've been repeatedly recognized by third-party analysts as a leader across network connectivity options: Wi-Fi, switching, and SD-WAN. No matter where you are in your network modernization journey, HPE is here to drive your networking success.
